

ABSTRACT

Apparatus, and associated method, provides for downloading an application with a selectable lifetime from an application database to a mobile terminal. The mobile terminal user's identification information
5 and the selected lifetime for the application are stored in an application-license database. When the user seeks to download the same application on a subsequent occasion the user is able to download that application for a reduced fee if lifetime remains from when the application was first downloaded. In addition, the application
10 may be configured to delete or uninstall itself from the mobile terminal when the selected lifetime for the application expires.
